

Password Is not Enough

One of the Cyber Warriors has told me that only password is not enough for account security.

You are right, it is not possible to remember long password. Even long password can be cracked by password cracking tools in minutes.

Even hackers can guess your password...

Then what should we do?
Remembering long password is not possible...

You should enable two-factor authentication for all your online accounts

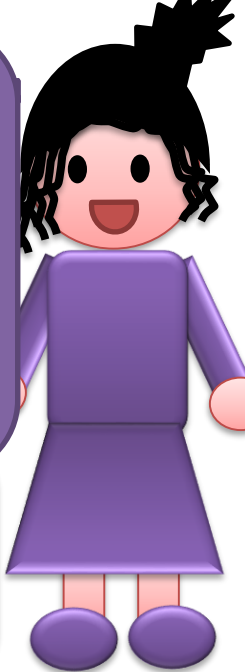

What is that?

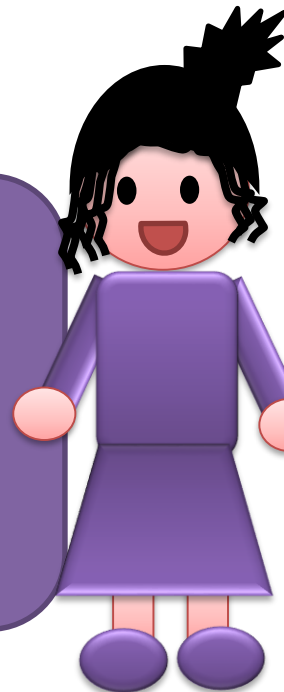

Password is a thing you know and remember. The multi-factor authentication is the combination of something we know, something we have and something we are.

But how can multi-factor authentication help?

WeSeSo aims to secure society. Go to www.weseso.org and take the cyber warrior quiz to become a cyber warrior and know more about cyber security!!

See, even hackers know your password, if you have enabled a multi-factor authentication on your account, then he needs one more validation thing to log on to your account, like OTP on your mobile..

Wow!! I got the point. Now I will enable multi-factor authentication on all my online accounts!!

Thank you!
A small effort by cyber warrior Keisha, a Delhi Public School student.
